#	Priority	Finding	Recommended action	Owner
1	Critical	Both water bodies are severely degraded. The channel is choked with a dense algae and weed mat covering up to 93% of its surface; the open lake peaks at 64% algae cover and carries the highest floating-waste count in the whole programme (977 records).	Commission a water-body restoration programme as the park's top priority: mechanical weed and algae removal, de-silting, nutrient and inflow control, and aeration. Investigate the inflow - this degree of eutrophication indicates a continuing nutrient or sewage load, not a one-off.	Engineering / Horticulture
4	High	328 bank-erosion records along stone-lined margins, with bare dry ground running to the water edge on both sides.	Stabilise and re-profile the eroded banks; establish a vegetated buffer strip to reduce runoff and silt entering the water.	Engineering / Horticulture
5	Medium	Green cover is patchy park-wide - lawn 10.7-19.8% with bare ground at 12-16%.	Reinstate ground cover on the bare areas, prioritising the strip between the paths and the water edge where erosion feeds the water body.	Horticulture Division
7	Process	Several items on the site record are simply not in these three clips: the bridge, children's rides, the water fountain, the main gate, excavation tools and streetlights.	Fly those specific features. The current three clips are weighted heavily toward the water bodies and under-represent the built assets that the site record flags as poor.	Survey / Drone Cell
8	Process	No class exists for: exposed wires, utility damage, bridge condition, gazebo condition, roof-surface garbage, streetlights, main gate, water pipes, or 'broken' as a state.	Several of these are the defects that matter most at this park. Vertical-surface and thin-linear-feature detection is a materially different problem from the ground-plane work done so far.
